

CUSTOM STRUCTURAL RACK SOLUTIONS

CUSTOM STRUCTURAL RACK & PLANT INTEGRATION

Steel support, without constraints.
Coordination that keeps every trade moving.

Engineered modular rack & platform systems for cable tray, busway, process piping, MEP, and rooftop equipment — plus multi-trade integration support designed alongside your EPC, fabricated in-house, and delivered ready for erection. **Full MEP engineering available when required.**

YEARS

We Don't Sell Steel. We Solve Problems.

Across mission-critical data centers, battery & EV plants, petrochemical facilities, pharma & food, logistics, and industrial campuses — one team engineers the support, coordinates the interfaces, and fabricates factory-direct. When the project requires it, we can also provide full MEP engineering.

PURPOSE-DRIVEN ENGINEERING

We engineer around your specific routing, loads, and seismic envelope. Every rack is a custom solution — sized to process equipment, utility density, and access.

DEDICATED PROJECT TEAM

One point of contact from design to delivery. No handoffs, no dropped details between structural support, MEP scope (when engaged), and multi-trade interfaces.

FACTORY-DIRECT CONTROL

In-house fabrication means no subcontractor gaps. Your finish, your schedule, your sequence, delivered. Coil-to-form-to-finish capability behind every shipment.

REAL-TIME VISIBILITY

Live fabrication tracking with scheduled shipments tied to your crane plan and erection sequence. *Select projects.

Allied Advanced Systems extends Allied's rack pedigree into plant MEP support, optional full MEP engineering, and integration coordination — so structural steel, utilities, and equipment platforms arrive as one coordinated package.

One Scope Map. Clear Boundaries.

Default: we engineer structural support and coordinate with your EPC/MEP.

Available when required: full MEP engineering — mechanical, electrical, plumbing / process utilities.

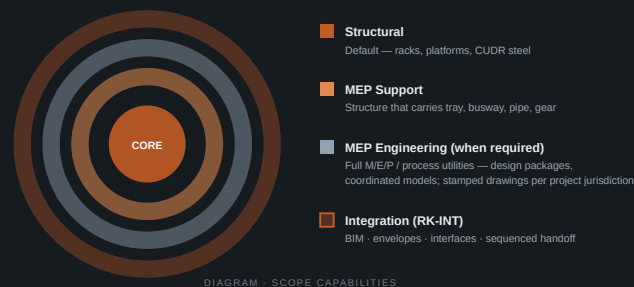

DIAGRAM · AAS CAPABILITY RINGS · NAVY TEXTURE FROM ORIGINAL BROCHURE

DEFAULT — AAS

Structural rack & platforms

RK-MAS · RK-MEP · RK-CUDR · Field-bolted, crane-sequenced assemblies with OSHA access provisions.

MEP support (structure for services)

Cable tray, busway, conduit, process piping · AHU / pump / HX / process platforms · Vibration & access framing.

Integration (RK-INT)

BIM clash awareness · Utility envelopes · Equipment interfaces · Sequenced delivery · Commissioning handoff packages.

AVAILABLE WHEN REQUIRED

Full MEP engineering

Mechanical, electrical, plumbing / process utilities as an offered scope — design packages, coordinated models, and stamped deliverables where applicable.

Stamped drawings provided per project jurisdiction where applicable.

Allied / AAS can provide the MEP engineering if required — alongside structural and integration.

COORDINATE WITH EPC / PARTNERS

When MEP engineering remains with the owner's team, we still engineer structural support and provide integration coordination alongside your:

- EPC / GC (schedule, crane, logistics)
- Designated MEP / electrical / process EOR
- Controls / automation vendors
- Equipment OEMs

Default = structural + coordinate. Full MEP engineering = available scope when required.

PRODUCT 01 / RK-MAS

Modular Aisle Structure for MEP support.

CABLE TRAY · BUSWAY · CONDUIT
HOT / COLD AISLE
CUSTOMIZABLE · MODULAR · SCALABLE

Engineered steel framing for electrical, mechanical, and plumbing services — configured around your routing, scaled bay by bay, and built to install fast.

BEST FOR Cable tray networks · Busway systems · Electrical conduit · Process & mechanical piping · Hot/cold aisle containment

CONFIGURATION Hot/cold aisle, multi-tier, single or double-stack. Modular bay spacing, scalable for future expansion without re-engineering primary steel.

FINISHES Powder coating · Epoxy polyurethane · Hot-dip galvanized · Primed · Custom colors on request

STANDARDS AWS · AISC · CSA A660 · Designed to local seismic & building codes

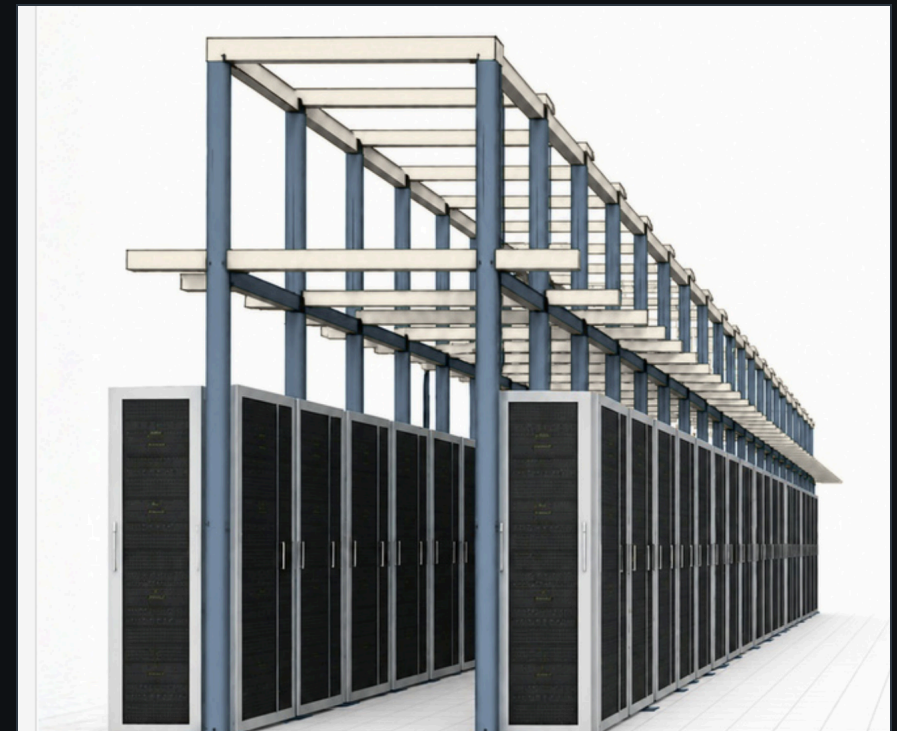

RK-MAS frames ship with clearances and attachment zones coordinated for multi-trade hangers, busway, and process lines — so MEP contractors pull wire and set pipe into a known geometry. Pair with optional AAS MEP engineering when design authority is needed in-house.

Future-flexible.

Add bays or tiers without re-engineering primary steel.

Coordinated routing.

IFC / Revit / SOLIDWORKS / BIM 360 model exchange standard.

TYPICAL APPLICATIONS

Data centers · Process plants · Battery / EV · Pharma & food · Logistics

Original Product 01 art · modular aisle structure render

PRODUCT 02 / RK-MEP

Custom platforms for the heavy stuff.

Steel platforms engineered for AHUs, pumps, heat exchangers, and process equipment — sized to your loads, prefabricated, and delivered ready for erection. Expanded for full M/E/P platform language: rooftop decks, chiller and pump skids, electrical gear platforms, and process modules.

DESIGNED FOR	Equipment dead & live loads · Vibration & serviceability · Maintenance & access · Plumbing & process skids · Electrical gear & busway landing platforms
GEOMETRY	Single or multi-level decks, custom plan dimensions, OSHA stairs/ladders/handrails, utility penetration zones and drip/containment framing.
FINISHES	Powder coating · Epoxy polyurethane · HDG for outdoor / coastal · Primed · Custom colors
DELIVERY	Prefabricated & field-bolted, minimal on-site welding, sequenced to crane schedule.

Platforms respect process loads, vibration criteria, and utility stubs — coordinated with OEM anchor patterns and your EPC crane plan. When full MEP engineering is in AAS scope, platform geometry and utility stubs are designed as one package.

Vibration-tuned.

Decking and bracing designed around equipment dynamics.

Inspection-ready.

Engineered access for serviceability from day one.

AHU · PUMPS · HEAT EXCHANGERS
PROCESS EQUIPMENT · ELECTRICAL GEAR
FULLY CUSTOMIZABLE · PREFABRICATED

IMAGERY ADAPTED FROM ALLIED STRUCTURAL RACK BROCHURE · PRODUCT 02

TYPICAL APPLICATIONS

Rooftop AHU decks · Chiller skids · Pump platforms · Process modules · Electrical / switchgear platforms · Heat-exchanger decks

Original Product 02 art · platform photo + render

PRODUCT 03 / RK-CUDR

Central Utility Distribution Rack.

HIGH LOAD CAPACITY
LONG SPAN
FULLY CUSTOMIZABLE

Long-span structural rack systems that organize, support, and route multi-trade utility networks across the site — preserving structural efficiency and giving every trade clear, serviceable corridors.

DESIGNED FOR	Span & load criteria · High piping & utility densities · Service zones · Integration with primary steel · Manufacturing cells with conveyance
CAPACITY	High-load, long-span configurations sized to equipment reactions, seismic envelope, and live loads — with expansion capacity reserved.
COORDINATION	Geometry tied to building columns; sequenced erection with primary structure. Multi-trade corridor allocation in BIM before steel hits the shop.
FINISHES	Powder coating · Epoxy polyurethane · Hot-dip galvanized · Primed · Custom colors

RK-CUDR geometry can be planned against facility utility envelopes — 480V paths, compressed air, exhaust / MUA, gas, and HVAC chases — so the steel corridor matches the plant's utility story. Optional AAS MEP engineering can own the utility design packages that feed those envelopes.

Clear utility corridors.

Unobstructed routing for piping, cabling, and all trades.

Integration-first.

Engineered with the building's primary steel from day one.

TYPICAL APPLICATIONS

Refining & petrochem · Battery & EV plants · Industrial campuses · Mission critical · Manufacturing / process cells

Original Product 03 art · pipe-rack photo + isometric

PRODUCT 04 / RK-INT

Integration that lands with the steel.

BIM · UTILITY ENVELOPES
EQUIPMENT INTERFACES
MEP ENG OPTIONAL · HANDOFF

RK-INT is the coordination layer on top of RK-MAS, RK-MEP, and RK-CUDR. We engineer the structural support *and* package the interfaces so EPC, trades, OEMs, and controls teams share one geometry, one sequence, and one punchable handoff. **When required, full MEP engineering slots into the same flow** — design packages and coordinated models before fabrication.

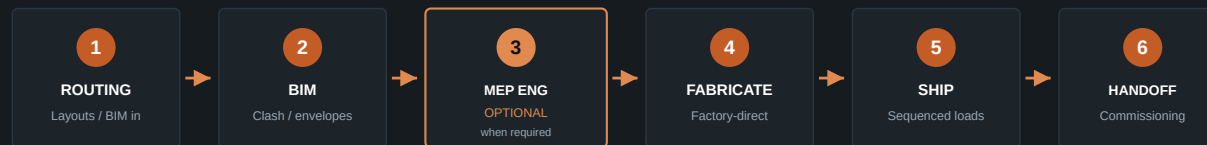

DIAGRAM · RK-INT 6-STEP INTEGRATION FLOW

DIAGRAM · 6-STEP INTEGRATION FLOW (MEP ENG OPTIONAL) · TEXTURE FROM ORIGINAL BROCHURE

01 · BIM MULTI-TRADE

IFC / Revit / BIM360 exchange; clash awareness for tray, pipe, busway, and structure; models aligned to erection sequence.

02 · UTILITY ENVELOPES

Corridor & platform geometry vs facility utilities — electrical paths, compressed air, exhaust, gas, HVAC / MUA — with owner MEP EOR or AAS MEP engineering.

03 · MEP ENG (OPTIONAL)

Full mechanical, electrical, plumbing / process utilities design packages & coordinated models when AAS is engaged for MEP engineering. Stamped drawings per project jurisdiction where applicable.

04 · EQUIPMENT INTERFACES

Reactions, vibration, access, and conveyance clearances packaged for OEM and EPC use.

05 · COMMISSIONING HANDOFF

Install sequence, utilities punch lists, FAT/SAT mindset packages — conceptual coordination; licensed PLC/HMI or safety-

06 · SEQUENCED DELIVERY

Shop packages and ship sets tied to crane plans — factory-direct visibility from design through outbound.

From routing to erection. One team.

1**ROUTING IN**

Send cable, pipe, busway, and equipment layouts (or BIM).

2**BIM / ENG**

Structural support sized to loads & seismic; clash awareness.

3**MEP ENG***

Optional — full M/E/P packages when required; stamped drawings per project jurisdiction.

4**FABRICATE**

Factory-direct, finish-matched, QC'd assemblies.

5**SHIP & ERECT**

Sequenced loads ready for field bolting and crane lifts.

6**HANDOFF**

Documentation for trades and commissioning teams.

FINISHES & STANDARDS

Powder coating · Epoxy polyurethane · Hot-dip galvanized · Primed · Custom colors

AWS · AISC · CSA A660 · Seismic to local codes · IFC / Revit / BIM360

MEP ENGINEERING NOTE

Allied / AAS can provide full MEP engineering if required — design packages, coordinated models, and stamped drawings per project jurisdiction where applicable.
